

Procedure for running Scheduler app

The app has been written in laravel 7.0 framework using PHP JWT token, and AJAX, JavaScript, JQuery, Bootstrap for frontend. With project comes SQL dump file, that needs to be included for the application to work.

When user access the application for the first time, it shows the login page of the app where user can type credentials for authorization. If user doesn't have an account there is a link that leads to the registration page, where user can registered with username and password (password should have format given in email). After that when user successfully has been registered, success message will appear, with link that leads user back to login page.

After user has been successfully logged in, it would be redirected to dashboard page. Dashboard page is a page with calendar, where user can add new event, by clicking it on the specified day in month. User also can select multiple day for the event, simply by dragging from start date to end date of the event. On the event there is a pen that, when is clicked user can edit the current event. There is also and X icon, where user can delete the event.
